**Select a Grain**

Cross polars

Choose only crystals

1. With albite twins that show uniform illumination when (010) is parallel to N-S cross hairs

2. With equal extinction angles to right and to left

**Make Measurements**

- Measure a large number (5-10) of crystals, recording the left and right extinction angles

- Select the largest angle measured for plotting on the Michel-Levy chart

- If max angle is less than 20°, then check Becke line to remove uncertainty
