## 12 Urysohn Metrization Theorem

12.1 Urysohn Metrization Theorem. Every second countable normal space is metrizable.

**12.2 Definition.** A continuous function  $i: X \to Y$  is an *embedding* if its restriction  $i: X \to i(X)$  is a homeomorphism (where i(X) has the topology of a subspace of Y).

**12.5 Lemma.** If  $j: X \to Y$  is an embedding and Y is a metrizable space then X is also metrizable.

**12.6 Definition.** Let  $\{X_i\}_{i\in I}$  be a family of topological spaces. The *product topology* on  $\prod_{i\in I} X_i$  is the topology generated by the basis

 $\mathcal{B} = \left\{ \prod_{i \in I} U_i \mid U_i \text{ is open in } X_i \text{ and } U_i \neq X_i \text{ for finitely many indices } i \text{ only} \right\}$ 

**12.8 Proposition.** Let  $\{X_i\}_{i\in I}$  be a family of topological spaces and for  $j\in I$  let

$$p_j \colon \prod_{i \in I} X_i \to X_j$$

be the projection onto the j-th factor:  $p_j((x_i)_{i \in I}) = x_j$ . Then:

- 1) for any  $j \in I$  the function  $p_j$  is continuous.
- 2) A function  $f: Y \to \prod_{i \in I} X_i$  is continuous if and only if the composition  $p_j f: Y \to X_j$  is continuous for all  $j \in I$

*Proof.* Exercise.

**12.10 Proposition.** If  $\{X_i\}_{i=1}^{\infty}$  is a countable family of metrizable spaces then  $\prod_{i=1}^{\infty} X_i$  is also a metrizable space.

**12.11 Example.** The *Hilbert cube* is the topological space  $[0,1]^{\aleph_0}$  obtained as the infinite countable product of the closed interval [0,1]:

$$[0,1]^{\aleph_0} = \prod_{i=1}^{\infty} [0,1]$$

Elements of  $[0,1]^{\aleph_0}$  are infinite sequences  $(t_i)=(t_1,t_2,\dots)$  where  $t_i\in[0,1]$  for  $i=1,2,\dots$  The Hilbert cube is a metric space with a metric  $\varrho$  given by

$$\varrho((t_i), (s_i)) = \sum_{i=1}^{\infty} \frac{1}{2^i} |t_i - s_i|$$

**12.12 Theorem.** If X is a second countable normal space then there exists an embedding  $j: X \to [0,1]^{\aleph_0}$ .

**12.13 Definition.** Let X be a topological space and let  $\{f_i\}_{i\in I}$  be a family of continuous functions  $f_i\colon X\to [0,1]$ . We say that the family  $\{f_i\}_{i\in I}$  separates points from closed sets if for any point  $x_0\in X$  and any closed set  $A\subseteq X$  such that  $x_0\notin A$  there is a function  $f_j\in \{f_i\}_{i\in I}$  such that  $f_j(x_0)>0$  and  $f_j|_A=0$ .

**12.14 Embedding Lemma.** Let X be a  $T_1$ -space. If  $\{f_i \colon X \to [0,1]\}_{i \in I}$  is a family that separates points from closed sets then the map

$$f_{\infty} \colon X \to \prod_{i \in I} [0, 1]$$

given by  $f_{\infty}(x) = (f_i(x))_{i \in I}$  is an embedding.

Proof of Theorem 12.12.

12.16 Proposition. Every second countable regular space is normal.
Proof. Exercise.
12.17 Urysohn Metrization Theorem (v.2). Every second countable regular space is metrizable.
<b>12.18 Definition.</b> Let $X$ be a topological space. A collection $\mathcal{U} = \{U_i\}_{i \in I}$ of open sets in $X$ is <i>locally finite</i> if each point $x \in X$ has an open neighborhood $V_x$ such that $V_x \cap U_i \neq \emptyset$ for finitely many $i \in I$ only.
A collection $\mathcal{U}$ is <i>countably locally finite</i> if it can be decomposed into a countable union $\mathcal{U} = \bigcup_{n=1}^{\infty} \mathcal{U}_n$ where each collection $\mathcal{U}_n$ is locally finite.
12.19 Nagata-Smirnov Metrization Theorem. Let $X$ be a topological space. The following conditions are equivalent:
<ol> <li>X is metrizable.</li> <li>X is regular and it has a basis which is countably locally finite.</li> </ol>
